

PART

UX Evaluation

5

Part 5 is about evaluating UX designs via their prototypes to explore alternative designs and to refine selected candidate designs. A full discussion of UX evaluation methods and techniques entails formative evaluation methods for finding and fixing UX problems in designs. These days, however, the discipline is leaning toward rapid methods that suffice, especially if evaluators hope to be agile. Chapters elaborate on preparation for evaluation, empirical data collection, analytic data collection, evaluation data analysis, and reporting of results.
