

Results of programming project competition

02285 AI and MAS, F25

- Teams get two scores in the interval $[0, 1]$ per level: one for number of actions (action cost), and one for time spent (time cost).
- Score is 1 for best known solution (minimum action cost, minimum time cost).
- Score is 0 if level is not solved.
- Otherwise the **level action score** for team X on level L is

$$\frac{\text{least number of actions used by any team on level } L}{\text{number of actions used by team } X \text{ on level } L}$$

and the **level time score** is, for some constant c ,

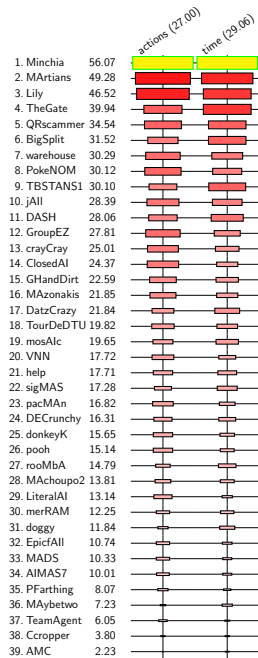

$$1 - c \log\left(\frac{\text{time spent by team } X \text{ on level } L}{\text{least time spent by any team on level } L}\right)$$

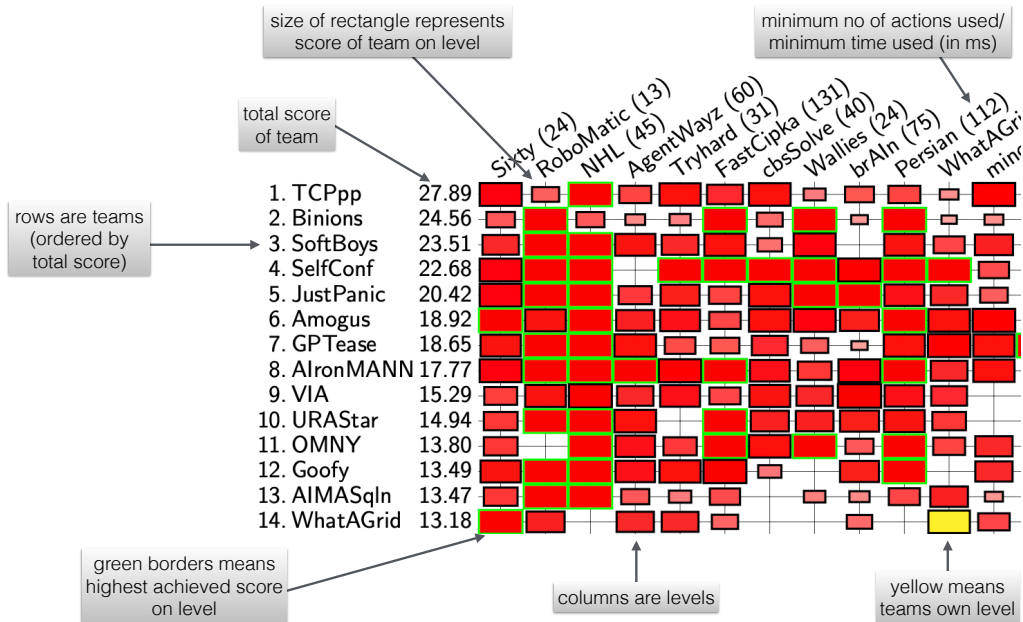

- The level action and time scores obtained on the individual levels are summed up to give the overall **action score** and **time score**. There are prizes for best action and time score. Finally, the action and time scores are also summed up to give an **overall score**, and there are prizes for the best n teams overall.

Prizes are generously sponsored by PDC:

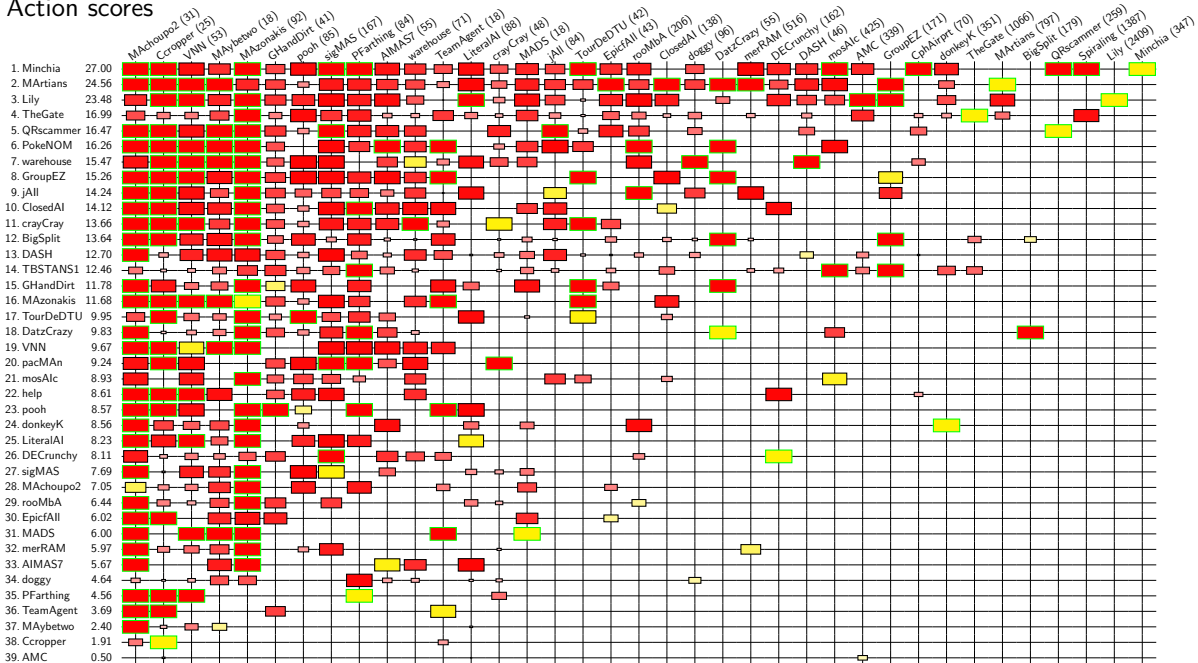

Overall scores

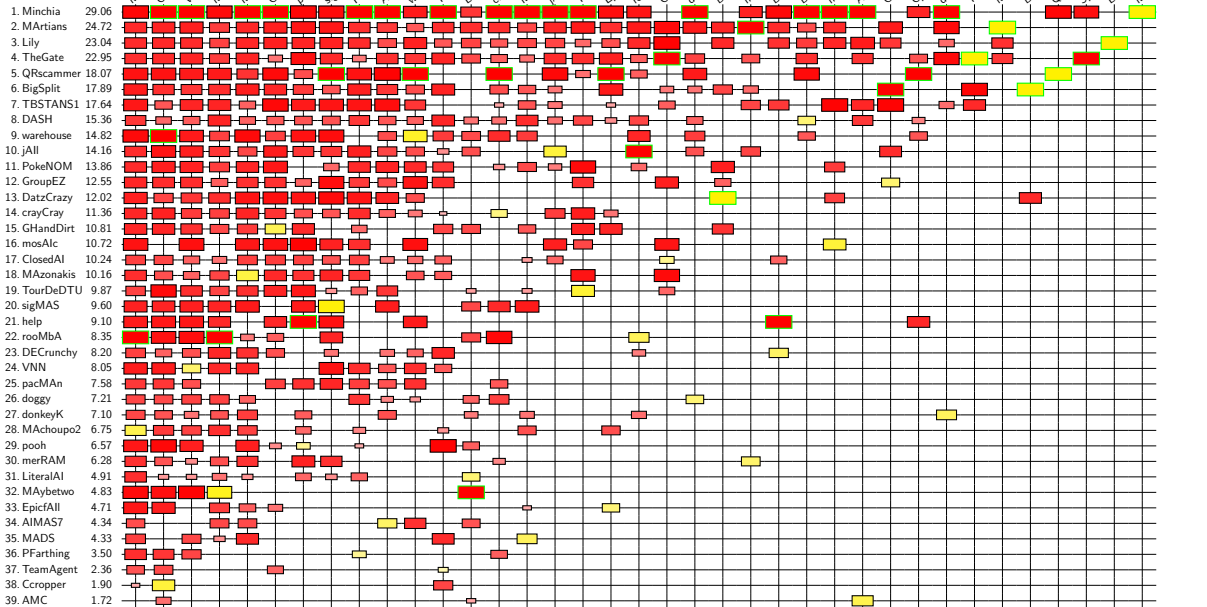

Action scores

Time scores

The “most interesting level” prize goes to
DASH
